

NAME

audit_detect_machine – Detects the current machine type

SYNOPSIS

```
#include <libaudit.h>
```

```
int audit_detect_machine(void);
```

DESCRIPTION

audit_detect_machine queries uname and converts the kernel machine string to an enum value defined in machine_t. The machine type is needed for any use of the audit_name_to_syscall function.

RETURN VALUE

Returns -1 if an error occurs; otherwise, the return value is the machine's type.

SEE ALSO

uname(3), audit_name_to_syscall(3).
