

NAME

auparse_first_record – reposition record cursor

SYNOPSIS

```
#include <auparse.h>
```

```
int auparse_first_record(auparse_state_t *au);"
```

DESCRIPTION

auparse_first_record repositions the internal cursors of the parsing library to point to the first field of the first record in the current event.

RETURN VALUE

Returns -1 if an error occurs, 0 if there is no event data, or 1 for success.

SEE ALSO

[auparse_next_event\(3\)](#), [auparse_next_record\(3\)](#).
