

NAME

auparse_node_compare – compares node name values

SYNOPSIS

```
#include <auparse.h>
```

```
int auparse_node_compare(const au_event_t *e1, const au_event_t *e2);
```

DESCRIPTION

auparse_node_compare compares the node name values of 2 events.

RETURN VALUE

Returns -1, 0, or 1 respectively depending on whether e2 is less than, equal to, or greater than e1. Since this is a string compare, it probably only matter that they are equal or not equal.

SEE ALSO

auparse_get_timestamp(3).
