

NAME

capng_restore_state – set the internal library state

SYNOPSIS

```
#include <cap-ng.h>
```

```
void capng_restore_state(void **state);
```

DESCRIPTION

capng_restore_state is a function that takes the state information previously saved by capng_save_state and restores the libraries internal state. This function is not available in the python bindings.

RETURN VALUE

None.

NOTES

capng_restore_state free's the previously malloc'd state, thus the state can't be restored multiple times.

The working pid is part of the restored state, if restoring the state to a different thread, capng_setpid can be used to update it.

SEE ALSO

capng_save_state(3), capabilities(7)
