NAME

BN_set_bit, BN_clear_bit, BN_is_bit_set, BN_mask_bits, BN_lshift, BN_lshift1, BN_rshift, BN_rshift1 − bit operations on BIGNUMs

SYNOPSIS

```
#include <openssl/bn.h>

int BN_set_bit(BIGNUM *a, int n);
int BN_clear_bit(BIGNUM *a, int n);

int BN_is_bit_set(const BIGNUM *a, int n);

int BN_mask_bits(BIGNUM *a, int n);

int BN_lshift(BIGNUM *r, const BIGNUM *a, int n);
int BN_lshift1(BIGNUM *r, BIGNUM *a);

int BN_rshift(BIGNUM *r, BIGNUM *a, int n);
int BN_rshift1(BIGNUM *r, BIGNUM *a);
```

DESCRIPTION

BN_set_bit() sets bit **n** in **a** to 1 (`a|=(1<<n)`). The number is expanded if necessary.

BN_clear_bit() sets bit **n** in **a** to 0 (`a&=~(1<<n)`). An error occurs if **a** is shorter than **n** bits.

BN_is_bit_set() tests if bit **n** in **a** is set.

BN_mask_bits() truncates **a** to an **n** bit number (`a&=~((~0)<<n)`). An error occurs if **n** is negative. An error is also returned if the internal representation of **a** is already shorter than **n** bits. The internal representation depends on the platform's word size, and this error can be safely ignored. Use **BN_num_bits**(3) to determine the exact number of bits if needed.

BN_lshift() shifts **a** left by **n** bits and places the result in **r** (`r=a*2^n`). Note that **n** must be nonnegative. **BN_lshift1()** shifts **a** left by one and places the result in **r** (`r=2*a`).

BN_rshift() shifts **a** right by **n** bits and places the result in **r** (`r=a/2^n`). Note that **n** must be nonnegative. **BN_rshift1()** shifts **a** right by one and places the result in **r** (`r=a/2`).

For the shift functions, **r** and **a** may be the same variable.

RETURN VALUES

BN_is_bit_set() returns 1 if the bit is set, 0 otherwise.

All other functions return 1 for success, 0 on error. The error codes can be obtained by **ERR_get_error**(3).
