

NAME

auparse_get_field_name – get current field's name

SYNOPSIS

```
#include <auparse.h>
```

```
const char * auparse_get_field_name(const auparse_state_t *au);"
```

DESCRIPTION

auparse_get_field_name allows access to the current field name of the current record in the current event.

RETURN VALUE

Returns NULL if an error occurs; otherwise, a pointer to the field's name.
