

NAME

ausearch_cur_event – check if the current event meets search criteria

SYNOPSIS

```
#include <auparse.h>
```

```
int ausearch_cur_event(auparse_state_t *au);"
```

DESCRIPTION

ausearch_cur_event will scan the input source and evaluate whether any record in the current event contains the data being searched for. Evaluation is done at the record level. If a match is found, the cursor is repositioned; otherwise, it remains on the last successfully parsed record within the current event.

RETURN VALUE

Returns -1 if an error occurs, 0 if no matches, and 1 for success.
