

**NAME**

docker-context-create - Create a context

**SYNOPSIS**

**docker context create [OPTIONS] CONTEXT**

**DESCRIPTION**

Create a context

Docker endpoint config:

|                                     |             |                                    |                                                         |
|-------------------------------------|-------------|------------------------------------|---------------------------------------------------------|
| NAME                                | DESCRIPTION | from                               | Copy named context's Docker endpoint configuration host |
| Docker endpoint on which to connect | ca          | Trust certs signed only by this CA | cert                                                    |
| Path to TLS certificate file        | key         | Path to TLS key file               | skip-tls-verify                                         |
|                                     |             |                                    | Skip TLS certificate validation                         |

Example:

```
$ docker context create my-context --description "some description" --docker "host=tcp://my-server:2376,ca=~/.ca-file,cert=~/.cert-file,key=~/.key-file"
```

**OPTIONS**

**--description=""** Description of the context

**--docker=[]** set the docker endpoint

**--from=""** create context from a named context
