

NAME

CURLINFO_LOCAL_IP – local IP address of last connection

SYNOPSIS

```
#include <curl/curl.h>
```

```
CURLcode curl_easy_getinfo(CURL *handle, CURLINFO_LOCAL_IP, char **ip);
```

DESCRIPTION

Pass a pointer to a char pointer to receive the pointer to a null-terminated string holding the IP address of the local end of most recent connection done with this **curl** handle. This string may be IPv6 when that is enabled. Note that you get a pointer to a memory area that is reused at next request so you need to copy the string if you want to keep the information.

The **ip** pointer is NULL or points to private memory. You **must not** free it. The memory gets freed automatically when you call *curl_easy_cleanup(3)* on the corresponding curl handle.

PROTOCOLS

This functionality affects quic and tcp

EXAMPLE

```
int main(void)
{
    char *ip;
    CURLcode result;
    CURL *curl = curl_easy_init();

    curl_easy_setopt(curl, CURLOPT_URL, "https://example.com");

    /* Perform the transfer */
    result = curl_easy_perform(curl);
    /* Check for errors */
    if((result == CURLE_OK) &&
        !curl_easy_getinfo(curl, CURLINFO_LOCAL_IP, &ip) && ip) {
        printf("Local IP: %s\n", ip);
    }

    /* always cleanup */
    curl_easy_cleanup(curl);
}
```

AVAILABILITY

Added in curl 7.21.0

RETURN VALUE

curl_easy_getinfo(3) returns a CURLcode indicating success or error.

CURLE_OK (0) means everything was OK, non-zero means an error occurred, see *libcurl-errors(3)*.
