

NAME

auparse_get_filename – get the filename where record was found

SYNOPSIS

```
#include <auparse.h>
```

```
const char * auparse_get_filename(const auparse_state_t *au);"
```

DESCRIPTION

auparse_get_filename will return the name of the source file where the record was found if the source type is AUSOURCE_FILE or AUSOURCE_FILE_ARRAY. For other source types the return value will be NULL.

RETURN VALUE

Returns pointer to a filename or NULL if unavailable.
