

NAME

auparse_get_node – get the event's machine node name

SYNOPSIS

```
#include <auparse.h>
```

```
const char * auparse_get_node(const auparse_state_t *au);"
```

DESCRIPTION

auparse_get_node gets the machine's node name if it exists in the audit event from the current event's timestamp data structure. Not all records have node names since its an admin configurable option.

RETURN VALUE

Returns a copy of the node name or NULL if it does not exist or there was an error. The caller must free the string.

SEE ALSO

auparse_get_timestamp(3), auparse_get_time(3), auparse_get_milli(3). auparse_get_serial(3).
