

NAME

`env-update` – updates environment settings automatically

SYNOPSIS

env-update [*options*]

DESCRIPTION

env-update reads the files in `/etc/env.d` and automatically generates `/etc/profile.env` and `/etc/ld.so.conf`. Then **ldconfig**(8) is run to update `/etc/ld.so.cache`. **env-update** is run by **emerge**(1) automatically after each package merge. Also, if you make changes to `/etc/env.d`, you should run **env-update** yourself for changes to take effect immediately. Note that this would only affect new processes. In order for the changes to affect your active shell, you will probably have to run `source /etc/profile` first.

OPTIONS

--no-ldconfig

Do not run **ldconfig** (and thus skip rebuilding the `ld.so.cache`, etc...).

REPORTING BUGS

Please report bugs via <https://bugs.gentoo.org/>
